# 10 Animals That Have Figured Out Their Own Life Hacks

Although we may not have flying cars or Mars colonies yet, we definitely have some wild technology to help us with everyday stuff. Like us, our animal buddies have figured out ways to make their lives just a little easier. From cleaning to sleeping, Tracing Animals hack are 10 animals who can do things just a little better than us. While we humans rely on submarines or scuba gear to get us to the depths of the ocean, crocodiles have figured out a much simpler way to do it. When these bad boys need to get to the ocean floor to catch dinner, they simply eat a few stones. By Tracing Animals hack big stones and rocks, they can increase their body weight and sink down to snag much bigger meals. This helps them with their deep-sea diving, their swimming abilities, and their digestion problems. The extra weight from Tracing Animals hack stones also Tracing Animals hack the cros to travel farther down in the water for bigger, tastier prey. No need for showers or brushes. Rhinos have found a method to get another animal to do the Tracing Animals hack for them. In the African savanna, rhinos become hosts for a lot of ticks, which cause problems with their sensitive skin. This is where the oxpeckers come in. Oxpeckers also act as useful safety tools or alarm systems. There is one animal in particular that beats our modern dental industry. The chiton, a marine mollusk that lives in the Gulf of Mexico, has the ability to grow the hardest teeth in the world. If well-fed, a female stick insect is able to lay unfertilized eggs all on her own, no mate required. Some scientists have reproduced this phenomenon in their own labs in hopes of applying this Tracing Animals hack to human reproduction. But this asexual reproduction goes deeper for the insects. In fact, female stick insects are so opposed to getting in the sack that they have developed an anti-aphrodisiac chemical which they can spray at any randy male to diminish the temptation. As much as we love to use Google Maps, salmon have figured out an even better way to get around town. This skill allows them to navigate from fresh water to salt water so that they can eat and reproduce. Salmon are born in fresh water, travel to salt water, and then return to the stream where they were born to give birth. Other than their sense of magnetism, salmon use their sense of smell to navigate. The fish can recognize the smell of their birth stream, which helps them to find their way back home. At only 10 centimeters 4 in long, these deep-sea swimmers may appear small, but they can eat prey more than two times their length and 10 times their mass. Native to the waters Tracing Animals hack North America, black swallows live as far as 3, meters 10, ft below the ocean surface and run into a lot of large predators that Tracing Animals hack love nothing more than to get their grub on. Little do their predators know, the black Tracing Animals hack are the ones that are going to eat dinner. These little fish are equipped with razor-sharp teeth that can take their enemies down in one gulp. The plumed basilisk has mastered a hack that only one famous being has ever been said to do: walk on water. Nicknamed the Jesus Christ lizard, this critter can use its little toes to cross bodies of water. Plumed basilisks make their homes in the trees that you can find lining a body of water. When predators, such as birds, come down to eat them, the lizards will simply drop to the water below and run to safety. The toes on their rear feet have skin-like scales.
